Azure Container Apps

Serverless containers for microservices

Build modern apps on open source

Focus on apps, not infrastructure

Seamlessly port to Kubernetes

kubernetes

envoy

Container options in Azure

Azure Container Instance

- Simple solutions for deploying containers with a fixed scaling need.
- Does not support auto scaling or changing scale without recreating the service (downtime).
- Assumes ingress (must expose a port), so it is clunky to run headless jobs.

Azure App Services

- Easily launch and deploy HTTP-oriented services in containers.
- Built for HTTP base solutions.
- Allows Slot deployments for Green/Blue.
- Replication control (1 app instance per node, per-site scaling options).
- Supports auto-scale based on Azure Monitor metrics across the whole.

Azure Kubernetes Services

- Cluster-as-a-service
- Microsoft manages the master nodes, worker nodes size/scale defined by you.
- Tight-integration with Azure services such as application gateway, monitor, identity, etc.
- Auto scale options across nodes, access to K8s based scaling options for apps.

Kubernetes on Azure VM

- Bring-your-own-solution, run on Azure IaaS

Differences between Container Apps and other Azure Products

- **Azure Container Instances** – Single Container Instance Only
- **Azure Kubernetes Service** – You own and operate Kubernetes yourself.
- **Azure Functions** – Must use Functions SDK and limited to a set of languages.
- **Azure Web Apps** – No event-driven workloads.

Most Options

Azure Container Apps

Azure Container Apps Benefits

Don't worry about a K8s cluster

Like Azure Container Instance, you just deploy the containers you want. There's no cluster to worry about.

Auto-scaling with greater depth

More options for scaling your instances out than on Azure App Service with KEDA

Blue-Green by default

No downtime required for any deployment or scaling operation

Access to microservice management toolchain

Like AKS, Optional access to microservice management toolchain Dapr.
gRPC or HTTP for internal service communication is available.

Azure Container Apps

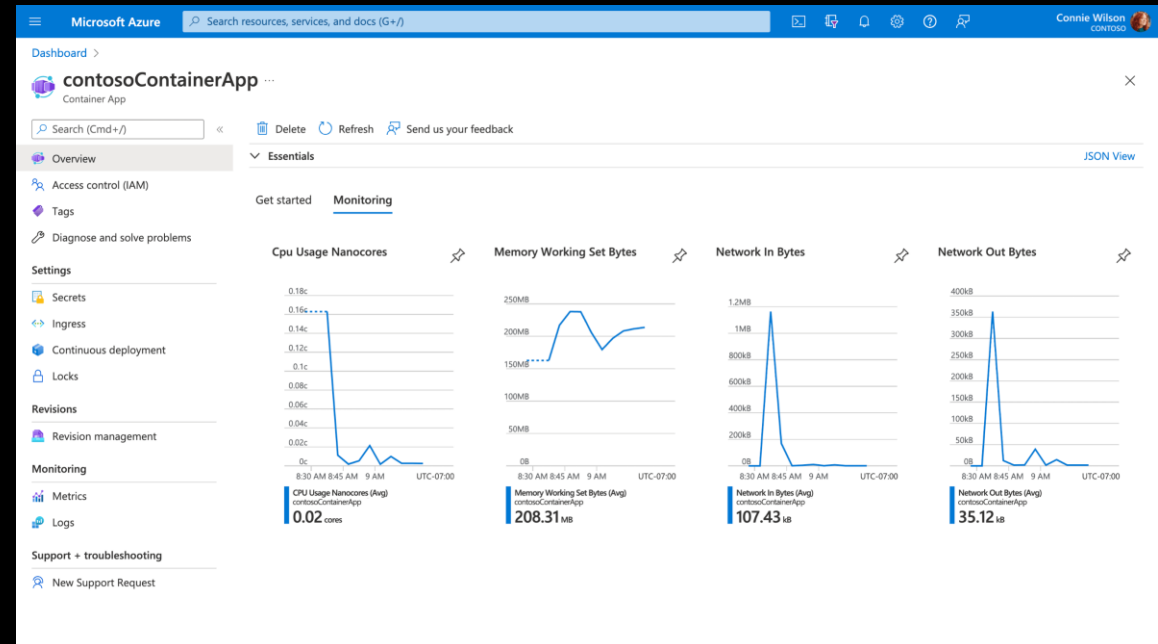

Scale with flexible serverless containers

Run containers and scale in response to HTTP traffic or a growing list of KEDA-supported scale trigger including Azure Event Hub, Apache Kafka, RabbitMQ Queue, MongoDB, MySQL and PostgreSQL.

Get robust autoscaling capabilities without the overhead of managing complex infrastructure.

Scale to zero and pay for only what you use, by the second.

Accelerate developer productivity

Build microservices, APIs, event processing workers, and background jobs using containers.

Write code in your favorite programming language and accelerate development with built-in Distributed Application Runtime (Dapr) integration to simplify common tasks like event processing, pub/sub, and service invocation.

Set up code-to-cloud pipeline using GitHub Actions.

Select any container image using any language or framework

Choose vCPU cores, memory, and scale settings based on events or HTTP requests

Enable service-to-service communication, configure ingress, and event sources

Create and deploy your application

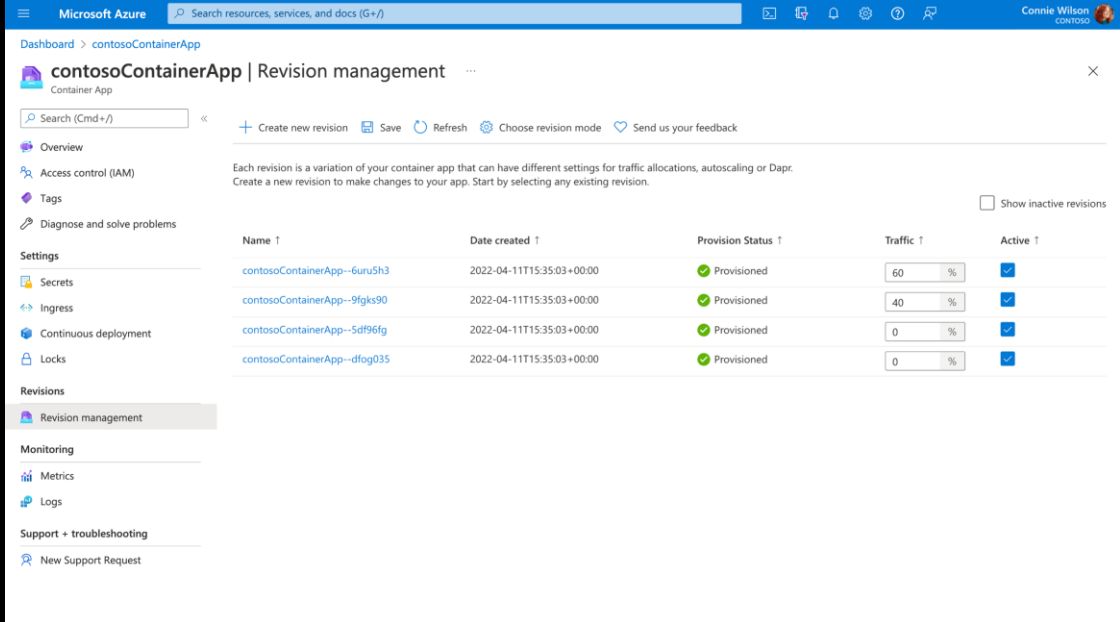

Build modern apps on open-source

Create modern apps with open standards on a Kubernetes foundation and portability in mind.

Contribute directly to OSS projects to influence product capabilities.

Rely on streamlined application lifecycle task such as application upgrades and versioning, traffic shifting, service discovery, and monitoring.

The screenshot displays the 'Revision management' interface in the Microsoft Azure portal. The left-hand navigation pane includes sections for Overview, Access control (IAM), Tags, Diagnose and solve problems, Settings (Secrets, Ingress, Continuous deployment, Locks), Revisions, Monitoring (Metrics, Logs), and Support (troubleshooting, New Support Request). The main content area features a search bar, action buttons for 'Create new revision', 'Save', 'Refresh', 'Choose revision mode', and 'Send us your feedback'. Below this, a table lists four revisions, all with a 'Provisioned' status and active checkboxes. The table columns are Name, Date created, Provision Status, Traffic, and Active.

Name ↑	Date created ↑	Provision Status ↑	Traffic ↑	Active ↑
contosoContainerApp--6uru5h3	2022-04-11T15:35:03+00:00	Provisioned	60 %	<input checked="" type="checkbox"/>
contosoContainerApp--9fgks90	2022-04-11T15:35:03+00:00	Provisioned	40 %	<input checked="" type="checkbox"/>
contosoContainerApp--5df96fg	2022-04-11T15:35:03+00:00	Provisioned	0 %	<input checked="" type="checkbox"/>
contosoContainerApp--dfog035	2022-04-11T15:35:03+00:00	Provisioned	0 %	<input checked="" type="checkbox"/>

What can you build with Azure Container Apps?

Microservices

Deploy and manage a microservices architecture with the option to integrate with DAPR.

AUTO-SCALE CRITERIA

Individual microservices can scale independently using any KEDA scale trigger.

Event-driven processing

E.g., queue reader application that processes messages as they arrive in a queue.

AUTO-SCALE CRITERIA

Scaling is determined by the number of messages in the queue.

Web Applications

Deploy web apps with custom domains, TLS certificates, and integrated authentication.

AUTO-SCALE CRITERIA

Scaling is determined by the number of concurrent HTTP request.

Public API endpoints

HTTP requests are split between two revisions of the app – the first revision gets 80% of the traffic, while a new revision receives 20%

AUTO-SCALE CRITERIA

Scaling is determined by the number of concurrent HTTP request.

Background processing

E.g., continuously running background process that transforms data in a database.

AUTO-SCALE CRITERIA

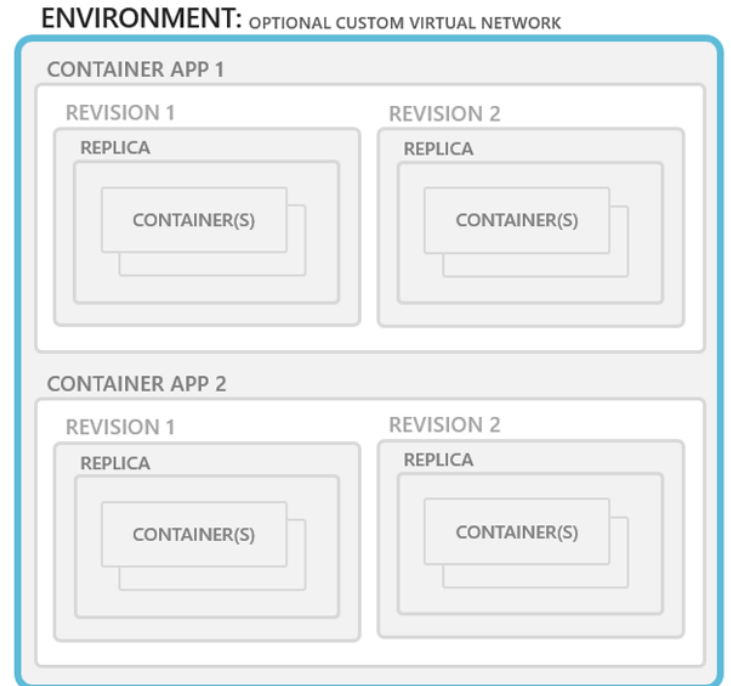

Scaling is determined by the level CPU or memory load.

Azure Container Apps environments

Environments define an isolation and observability boundary around a collection of container apps deployed in the same virtual network.

Environments are an isolation boundary around a collection of container apps.

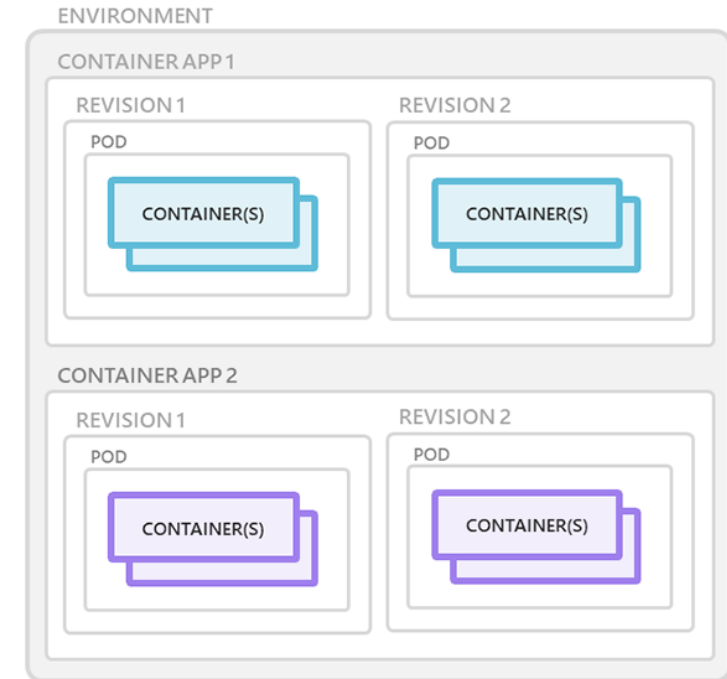

Containers

Containers for an Azure Container App are grouped together in pods inside revision snapshots.

Containers for an Azure Container App are grouped together in pods inside revision snapshots.

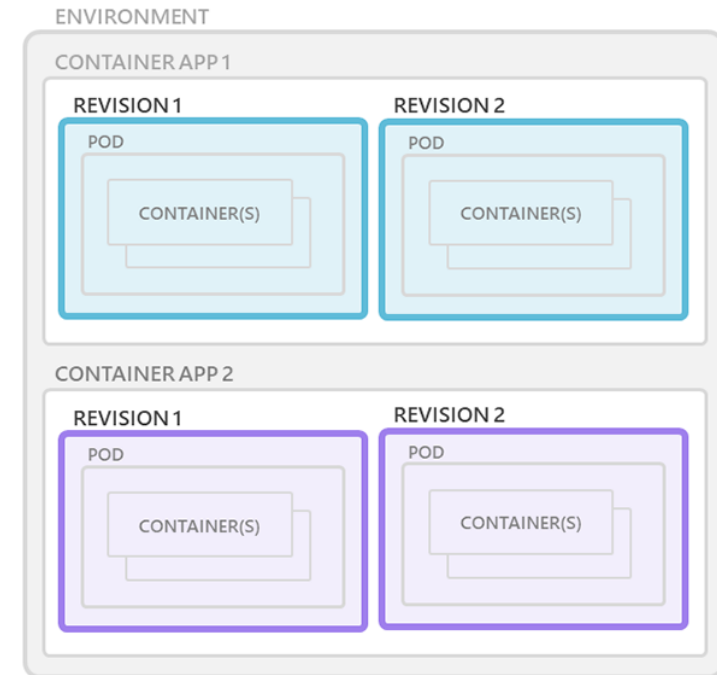

Revisions

Revisions are immutable version snapshots of a container app.

Revisions are immutable snapshots of a container app.

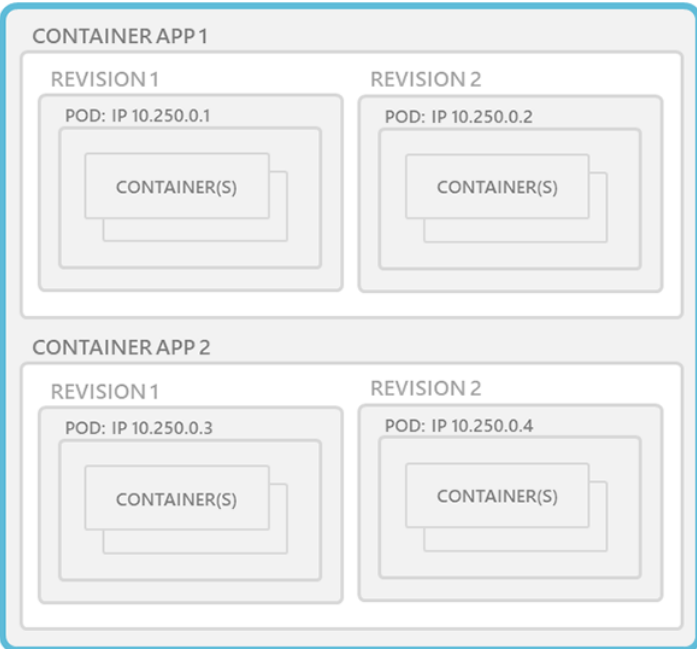

Virtual Network

Internal or external visibility with
TLS termination and support for
HTTP/1.1 and HTTP/2 Ingress

A **virtual network**
creates a secure
boundary around
your Azure Container
Apps environment.

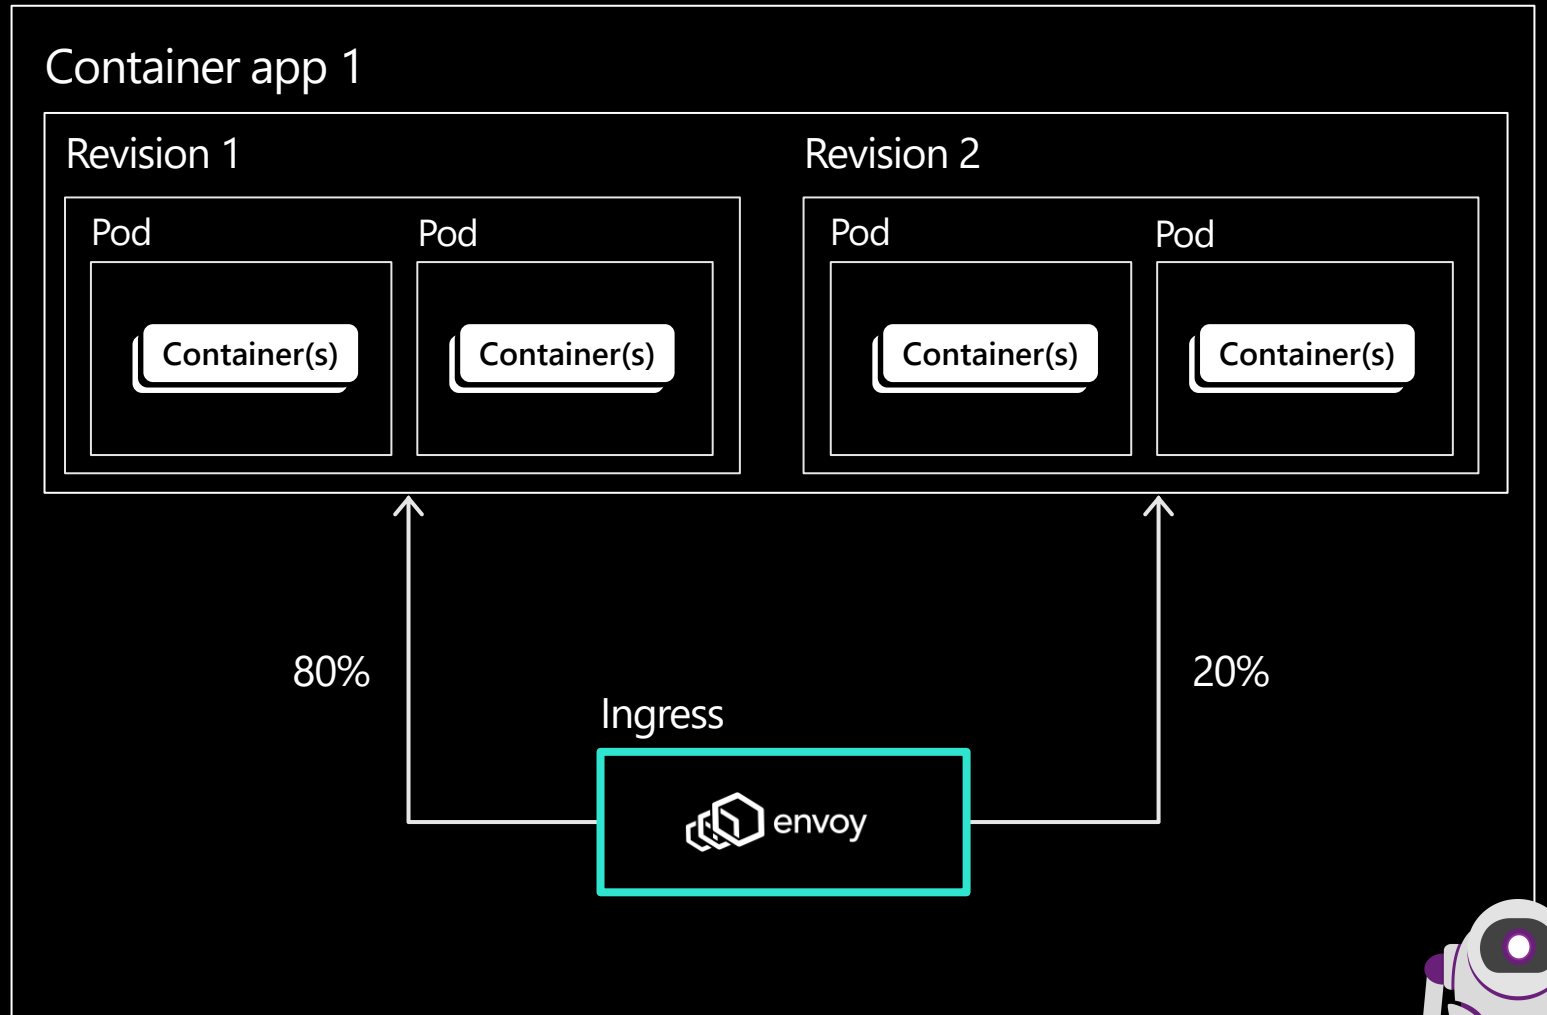

ENVIRONMENT: OPTIONAL CUSTOM VIRTUAL NETWORK

Ingress

Internal or external visibility with TLS termination and support for HTTP/1.1 and HTTP/2

Environment (virtual network boundary)

Secrets management

Securely store sensitive configuration elements that are then available to containers through environment variables, scale rules, and Dapr

```
"template": {
  "containers": [
    {
      "image": "myregistry/myQueueApp:v1",
      "name": "myQueueApp",
      "env": [
        {
          "name": "QueueName",
          "value": "myqueue"
        },
        {
          "name": "ConnectionString",
          "secretref": "queue-connection-string"
        }
      ]
    }
  ],
}
```

Managed Identity

A **system-assigned identity** is tied to your container app and is deleted when your container app is deleted. An app can only have one system-assigned identity.

A **user-assigned identity** is a standalone Azure resource that can be assigned to your container app and other resources. A container app can have multiple user-assigned identities. The identity exists until you delete them.

Limitations:

- Pull an image from Azure Container Registry
- Define scaling rules or Dapr configuration
- To access resources that require a connection string or key, such as storage resources, you'll still need to include the connection string or key in the secretRef of the scaling rule.

Observability

- Log Analytics – stderr/stdout, small delay
- Metrics – CPU, Memory, Bytes in/out, Requests
- Alerts – based on metrics, log search, admin signals (e.g., create, update, delete container app)
- Streaming Logs – stderr/stdout, real-time:

az containerapp logs show -n MyContainerapp -g MyResourceGroup

- Connect to Console – connect to run shell commands

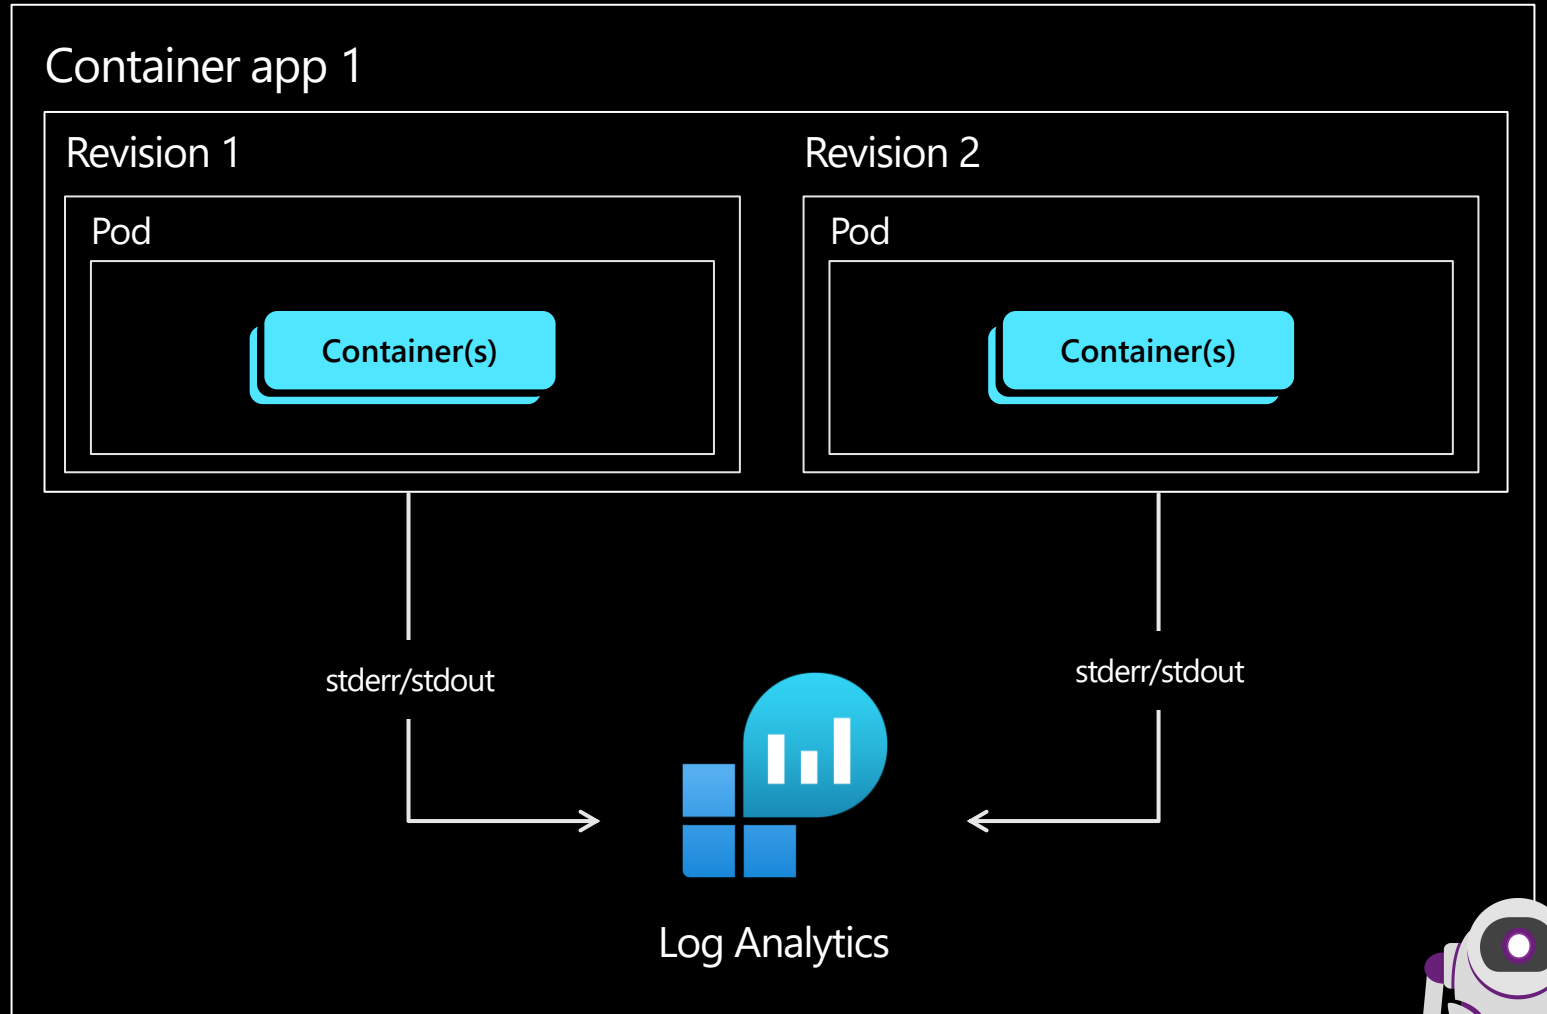

az containerapp exec -n MyContainerapp -g MyResourceGroup --command bash

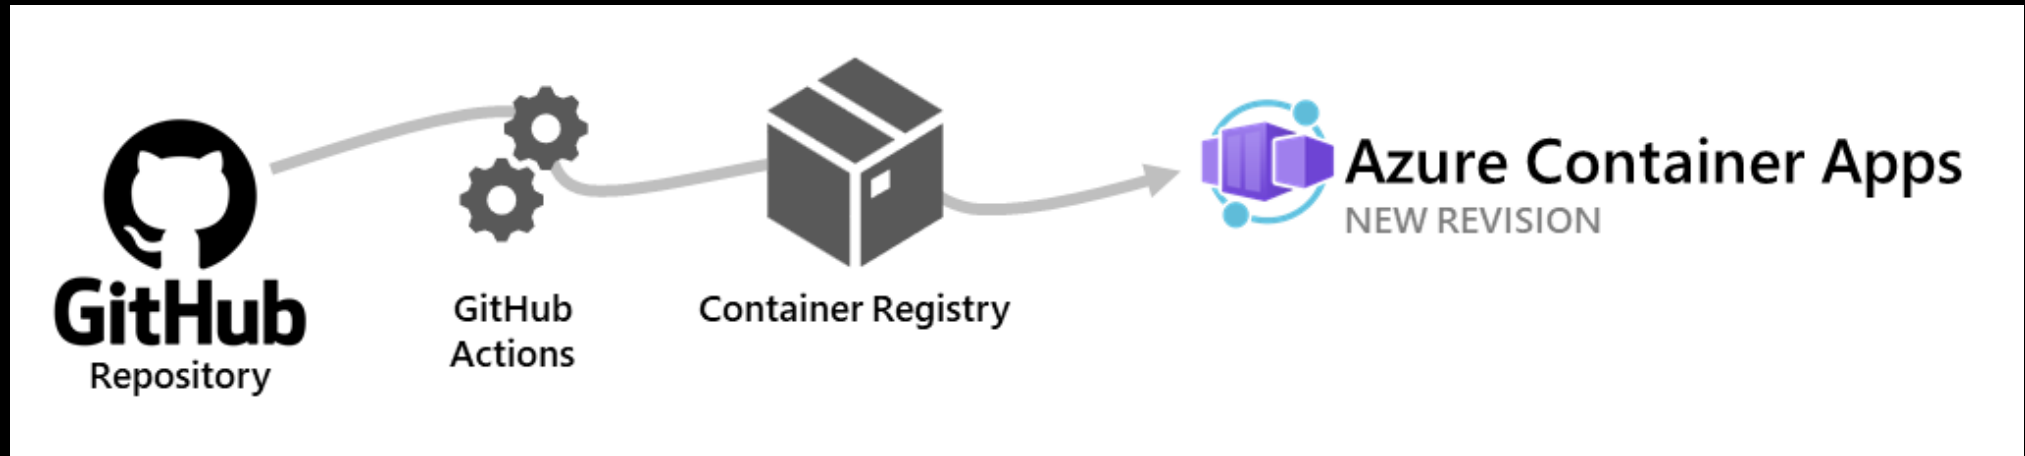

Logging

Containers write logs to standard output or standard error streams surfaced via Log Analytics

Environment

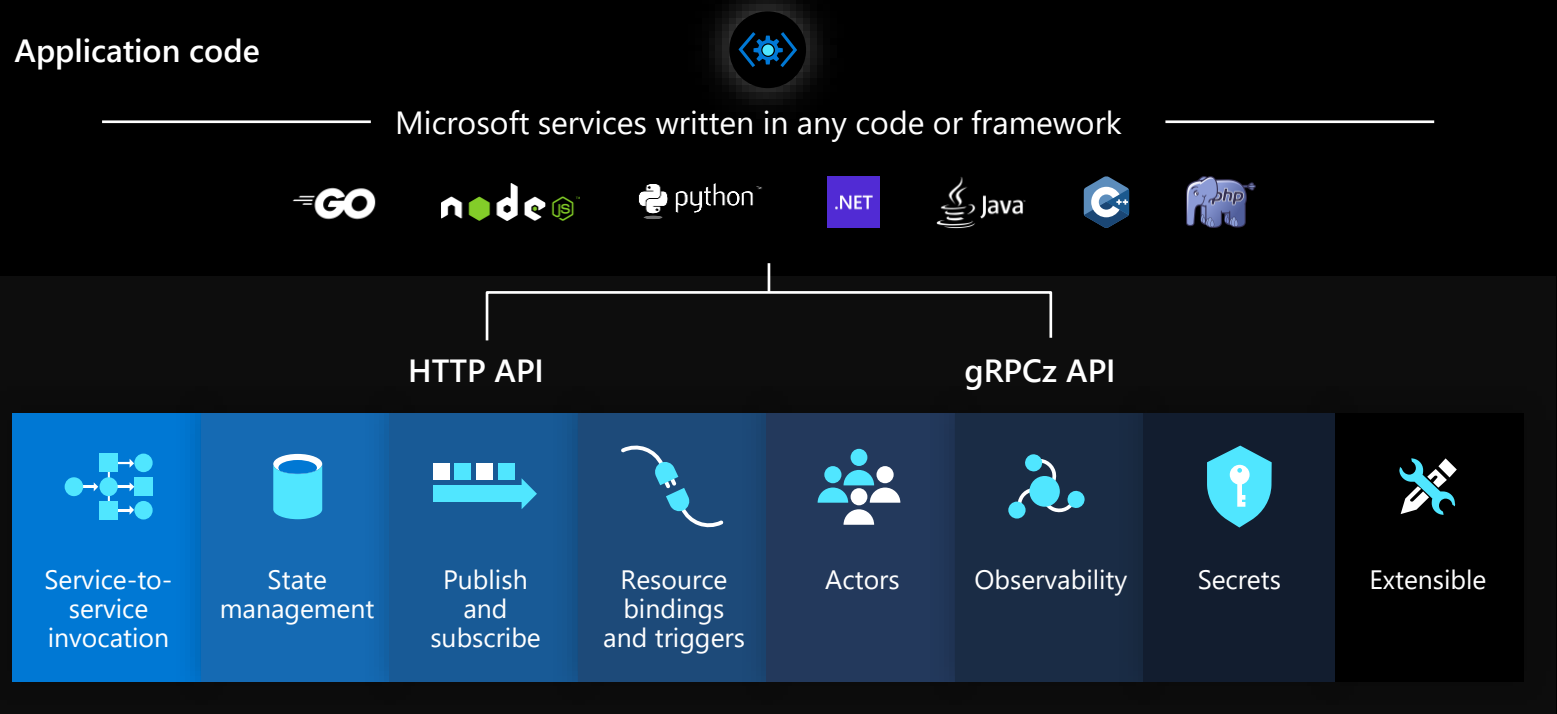

Microservices using any language or framework

Any cloud or edge infrastructure

Distributed Application Runtime

Portable, event-driven, runtime for building distributed applications across cloud and edge

Hosting infrastructure

dapr.io

Microsoft Azure

Azure Arc

aws

Google Cloud

Alibaba Cloud

kubernetes

On-prem

#netcoreconf

Fully managed Dapr using the sidecar model

Service-to-service invocation

POST `http://localhost:3500/v1.0/invoke/cart/method/neworder`

State management

GET `http://localhost:3500/v1.0/state/inventory/item67`

Publish and subscribe

POST `http://localhost:3500/v1.0/publish/shipping/orders`

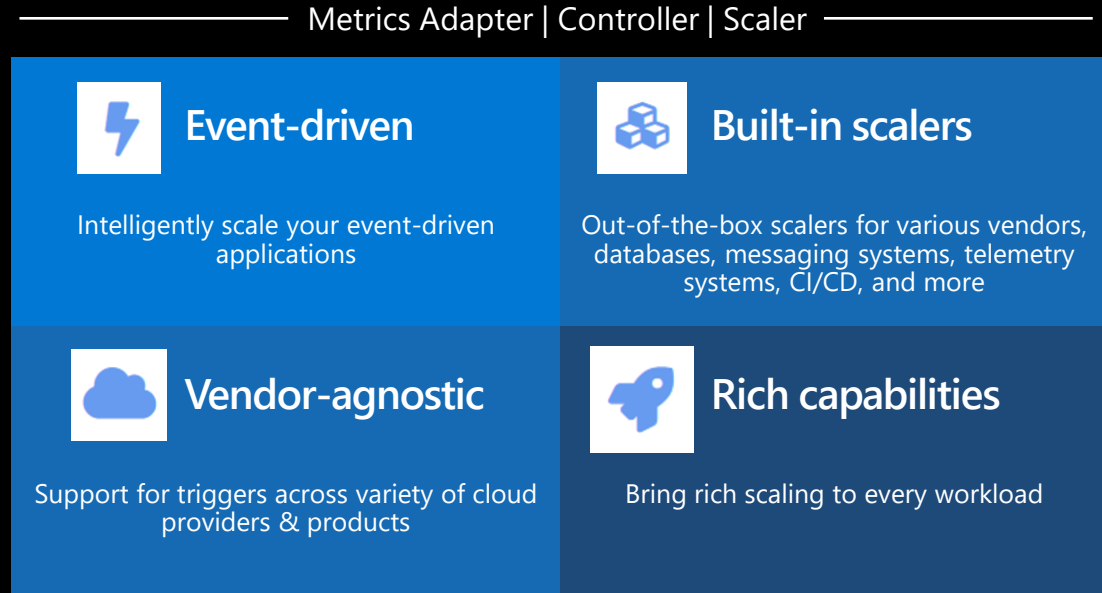

Application autoscaling **made simple**

Open-source, extensible, and vendor agnostic

Kubernetes-based Event Driven Autoscaler

Drive the scaling of any container based on a growing list of 35+ event sources, known as: scalers

keda.sh

#netcoreconf

Scaling

HTTP

```
{
  "name": "http-rule",
  "http": {
    "metadata": {
      "concurrentRequests": 50
    }
  }
}
```

Event-driven

artemis-queue, kafka, aws-cloudwatch, aws-kinesis-stream, aws-sqs-queue, azure-blob, azure-eventhub, azure-servicebus, azure-queue, cron, external, gcp-pubsub, huawei-cloudeye, ibmmq, influxdb, mongodb, mssql, mysql, postgresql, rabbitmq, redis, redis-streams, selenium-grid, solace-event-queue, ..

CPU

```
{
  "name": "cpu-rule",
  "custom": {
    "type": "cpu",
    "metadata": {
      "type": "Utilization",
      "value": "50"
    }
  }
}
```

Memory

```
{
  "name": "mem-rule",
  "custom": {
    "type": "memory",
    "metadata": {
      "type": "AverageValue",
      "value": "512"
    }
  }
}
```

Support for scale to zero and specifying minimum/maximum replicas
